

Accelerated Hybrid Cloud for Creative Professionals

CHALLENGES

Video editing is one of the most compute-intensive workflow that has been traditionally performed by a team in a high-performance storage network. However, with the trend of distributed workplaces, team collaboration across multiple edit sites has posed a challenge given the size of the media files. The use of proxy and compression codecs can help but does not completely mitigate the file access challenges. These challenges include:

- Time and cost of file transfer among sites (How do I send over these large files?)
- Revision management (Did you get the latest file?)
- Record keeping of all file operations (Did someone delete the files? How do I recover them?)

SOLUTIONS

Morro Data Global File System and cloud caching technology bring the file server to you, allowing for high-performance file creation, editing, and production across distributed workplaces. With automatic version control, you'll always have the latest file version at your fingertips and get file recovery in minutes. Plus, Morro Audit tracks all file access for retrospective investigation and ransomware protection.

Fast Large File
Sync & Share

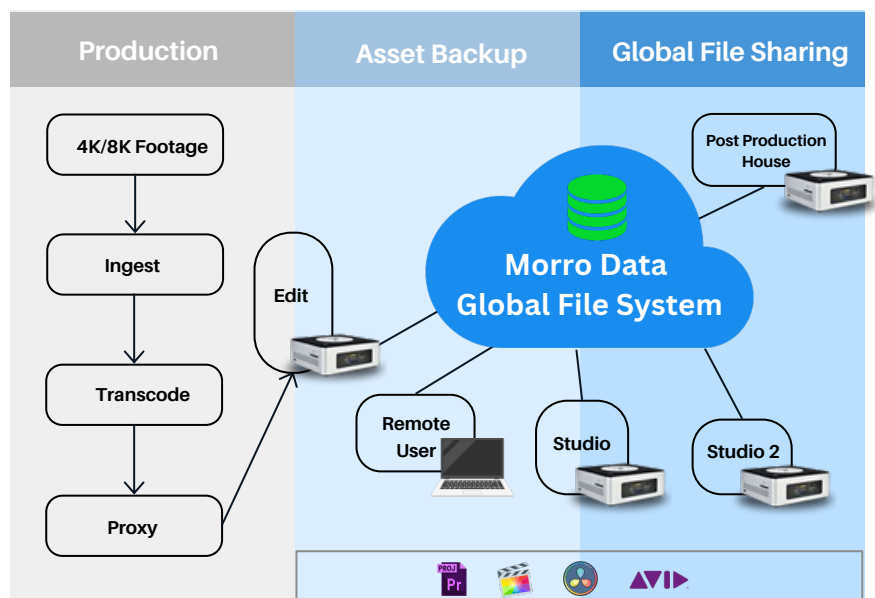

Centralized
Management

Secure Global
Collaboration

HOW IT WORKS

Media Instant Sync and Share Collaboration

At A Glance

- Primarily used for **file server consolidation** and enables businesses to centralize their storage infrastructure and provide **remote access**.
- Unlimited storage and performance scalability. Easily handle large amounts of data.
- **Automated backups** and multiple **file recovery** options.
- Risk Signal Management for Ransomware
